used with Factor V protein fragments in a novel method to detect the presence of a mutated protein in a sample that may also contain the corresponding wild-type protein. The method is used to detect mutations that alter protein functions (either point mutation or small insertions or deletions), particularly in proteins involved in blood coagulation or metabolism of fat. Protein functions which are specially detectable are the Leyden mutation in factor V (associated with increased risk of deep vein thrombosis), mutations in apolipoprotein (apo) genes (certain alleles of apoE indicates increased risk of developing Alzheimer's disease), thermostable 5,10-methylenetetrahydrofolate reductase (associated with hypercysteinaemia and venous thrombosis) and factor VII mutations (associated with increased risk of cardiovascular disease).                                                                                                                                                                                                                                                                                                                                                     Detecting or quantifying mu comprises reaction with lig factors or apolipoproteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       apolipoprotein B-100 (apoB-100). ApoB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density lipoprotein (IDL), low density lipoproteins (LDL) and lipoprotein a. The present sequence can be used in the composition of the invention. The specification describes a composition that comprises LDL and apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in vivo or in vitro, for expressing a therapeutic polypeptide or antisense molecule (or ribozyme). Specifically they are used for gene therapy of cancers (particularly non-small cell lung carcinoma), diabetes, cystic fibratic and straticularly non-small cell lung carcinoma), diabetes, cystic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Factor V; human; detection; protein function; blood coagulation; apo; fat metabolism; Leyden mutation; deep vein thrombosis; apolipoprotein; Alzheimer's disease; 5,10-methylenetetrahydrofolate reductase; prion; hypercysteinaemia; factor VII; cardiovascular disease; pathogen; virus
                                                                                                                                                                                                                                                                    AAW64587 and AAW64588 are fragments of human apolipoprotein which are

                                            AAW96827-77 represent nucleic acid binding domains derived from human apolipoprotein B-100 (apoB-100). ApoB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density lipoprotein (IDL), low density lipoproteins ((LDL) and lipoprotein a. The present sequence can be used in the composition of the invention. The specification describes a composition that comprises LDL and apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in vivo or in vitro, for expressing a therapeutic polypeptide or antisense molecule (or ribozyme). Specifically they are used for gene therapy of cancers (particularly non-small cell lung carcinoma), diabetes, cystic fibrosis and arteriosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   method can also be applied to proteins from pathogens, e.g. viruses or prions. The method does not require complex apparatus for polymerase chain reactions, it is simple, standardisable and reliable and is particularly suited to routine screening. It also allows mutant protein in a sample to be quantified

                                        ABG52504 standard; peptide; 343 AA
                                                                                                                                                                                The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and present sequence is a peptide encoded by a single exon nucleic acid probe for the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                     04-FEB-2000; 2000US-0180312P.

                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      measuring human gene expression in a sample derived from human adult comprising one of 13109 defined nucleotide sequences given in the stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be used for predicting, measuring and displaying gene expression complements in the human adult liver. The genes identified may be used from human adult liver. The genes identified may be hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is consisted with coronary heart disease.                               . AAR34031;
                                                   The inventors claim a portion of the polypeptide contg. apo B-100 that immunoreacts with antibodies secreted by the hybridoma MB47 having ATCC Accession No. 8746. Polypeptides specifically claimed include residues 217-297, 216-310, 216-331, 216-352, 216-377, 1-377, 205-297, 173-297, 140-297. DNA sequences encoding the polypeptides are also claimed. Also claimed are a fusion polypolypeptide that contains: (a) a first maino acid residue sequence up to 250 residues in length that includes residues 120-135 of apo A-I, (b) a second amino acid residue sequence up to 375 residues in length that includes residues 217-297 of apo B-100 and DNA encoding it. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                        09-OCT-1991;

This non-cell CC associated protein is one of a set of proteins characterised as associated protein is one of a set of proteins characterised as CC diagnostic targets for hepatocellular carcinoma (HCC). Such proteins are CC the products of genes identified by expression microarray analysis of the products of genes identified by expression microarray analysis of CC tenour samples from hepatitis C virus (HCV) infected patients with HCC as CC infected cirrhotic non-tumour tissue and normal liver. The invention CC crelates to the detection of HCC by assaying patient samples such as CC related proteins. A finding of the presence and level of specific HCC CC proteins in a patient sample indicates that the patient has HCC. Methods CC and scanning methods that employ non-cell-associated and cell-associated xxx

A; Residues: 2169-2179 <hOS>
A; Note: the sequence shown represents the carboxyl end of apolipoprote A; Note: two RNA species, 14.1kb and 7.5kb in length, were isolated from the codes the 250K apoB-48, CAA encoding 2180-Gln is substituted by Ryang, C.; Kim, T.W.; Weng, S.; Lee, B.; Yang, M.; Gotto Jr., A.M.

X Apo B; binding site; receptor; cancer; drug delivery; anticancer; growth supplement; non-natural lipid particle; low density lipopr LDL; receptor component; apo B100 receptor site. Halbert GW, 27-SEP-1996; Synthetic. 03-AUG-1998 (first entry) AAW57205 standard; peptide; 25-SEP-1997; 02-APR-1998. WO9813385-A2. Apo B binding site peptide 2. AAW57205; (UYST) UNIV STRATHCLYDE Owens MD, 96GB-00020153 97WO-GB002610. Baillie 11 ₿ <u>ი</u> density lipoprotein;

The present sequence represents a specifically claimed Apo B binding site peptide which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KAEYKKNKHRH (1) or TTRLTRKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring, Claim 12; Page 52; 73pp; English. Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells that express this receptor.

WPI; 1998-230637/20.

The present sequence represents a specifically claimed Apo B 100 binding CC Site peptide analogue which can be used as a component of a non-
CC naturally occurring, receptor-competent low density lipoprotein (LDL)
CC particle of the present invention. The LDL particle comprises at least 1
CC peptide component that has at least 1 binding site for an apo B protein
CC invention are peptides containing an apo B binding sequence with at least
CC dimers. Non-naturally occurring, receptor-competent LDL particles are
CC dimers. Non-naturally occurring, receptor-competent LDL particles are
CC cancer cells that express an apo B protein receptor and (ii) additives
CC coccurring, receptor-competent LDL particles are
CC coccurring, receptor-competent LDL particles are
CC coccurring, receptor-competent LDL particles are
CC apo B sequence, which is large and tends to aggregate, to provide binding
CC affinity to an apo B protein receptor and (ii) additives
CC affinity to an apo B protein receptor and the complete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş

CC The present sequence is an analogue of apoprotein B 100. The peptide, CC which has Ly85 conjugated with malondialehyde (MDA), inhibits uptake of CC apoprotein B-based low density lipoprotein (LDL) (or partly modified CC antibodies are useful in treatment and diagnosis, especially for CC atherosclerosis. Atherosclerosis is characterised by thickening and CC streaks containing foam cells and, secondly, the formation of fatty CC plaques within the artery. Foam cells are formed by endocytosis of coxidised LDL by macrophages via a scavenger receptor, which causes cells core receptors. The peptides of the invention are oxidised and present CC receptors. The peptides of the invention are oxidised and present CC receptor, so preventing LDL uptake by the high affinity LDL cc receptor, so preventing LDL uptake by the high affinity LDL receptor, and complete cell formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 3

                                                                                                                                                                   The invention relates to bone strength and mineralisation regulatory protein (BSMR) and its corresponding nucleic acid sequence. BSMR DNA is useful for the diagnosis or therapy of osteoporosis and for regulating (increasing) bone strength and mineralisation in a human subject by activating bone density regulating transmembrane receptor (BSMR protein). An expression vector comprising a promoter that is operably linked to BSMR DNA is useful for modulating bone density and for enhancing bone strength and mineralisation in a mammal cell. Composition comprising a BSMR effector is useful for treating osteoporosis and is useful particularly as a coating for prosthetic devices and surgical implants. BSMR is useful for screening lead pharmaceutical agents as BSMR effectors, which may be used to treat a range of eye disorders such as diabetic retinopathy, hypertensive retinopathy and retinopathy of prematurity, in which mormal vascular growth and integrity of ocular
                                                                                                                                                       prematurity, in which vessels is disrupted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bone strength and mineralisation regulatory protein; BSMR; bone st
